
Basket Client Documentation

Release stable

March 19, 2015

1	Usage	3
1.1	Settings	3

This is a client for Mozilla's email subscription service, [basket](#). Basket is not a real subscription service, but it talks to a real one and we don't really care who/what it is.

There are four API methods: `subscribe`, `unsubscribe`, `user`, and `update_user`. View the [basket documentation](#) for details.

Usage

Are you looking to integrate this on a site for email subscriptions? All you need to do is:

```
import basket  
basket.subscribe('<email>', '<newsletter>', <kwargs>)
```

You can pass additional fields as keyword arguments, such as format and country. For a list of available fields and newsletters, see the basket [documentation](#).

Are you checking to see if a user was successfully subscribed? You can use the *debug-user* method like so:

```
import basket  
basket.debug_user('<email>', '<supertoken>')
```

And it return full details about the user. <supertoken> is a special token that grants you admin access to the data. Check with James Long (jlong@mozilla.com) to get it.

1.1 Settings

BASKET_URL URL to basket server, e.g. *<https://basket.mozilla.com>*
